Patrick Winter	Washington Univ.

Study Objectives

- **Study was not designed to:**

- Disprove that Cr(VI) is carcinogenic in mouse small intestine (NTP, 2008)
- Supplant the NTP 2-yr bioassay as basis for risk assessment
- Question the relevance of intestinal tumors to humans

- **Study was designed to:**

- Inform the MOA for intestinal tumors in mice
 - Inclusion of lower doses and earlier time points
 - Inclusion of additional analyses (PK, pathology, biochemistry)
- Inform which risk assessment approaches are best suited for assessing the carcinogenic risk of Cr(VI) via ingestion
- To collect pharmacokinetic data to aid in extrapolation to humans
 - Kirman et al. (2012), rodent PBPK model
 - Kirman et al. (2013), human PBPK model
 - EPA-authored PBPK model (in peer-review)

90-Day Studies Listed in Table 3-2 Provide Much More Information than Contained in the Two Cited Manuscripts

90-Day Study in Table 3-2 (Histological Changes Occur in Villi Before Crypts)

	Incidence of Lesion						
SDD, mg/L:	0	0.3	4	14	60	170	520
<u>Day 8</u>							
Villous vacuolization	0/5	0/5	0/5	0/5	0/5	3/5	5/5
Crypt hyperplasia	0/5	0/5	0/5	0/5	0/5	0/5	3/5
<u>Day 91</u>							
Villous vacuolization	0/10	0/10	0/10	0/10	5/10	10/10	7/10
Crypt hyperplasia	0/10	0/10	0/10	0/10	0/10	9/10	9/10

ToxStrategies

Can Tumors Arise from Villi?-Part 1

Transgenic Mice with Dual Mutations

Aberrant Foci via H&E

- foci not observed in MOA study (Thompson et al., submitted)
- foci not reported in NTP studies
- TNFα protein decreased in MOA study (Thompson et al., 2011)
- TNFα mRNA decreased in MOA study (Kopec et al., 2012)

Adapted from Schwitalla et al. (2013)

6

ToxStrategies

Can Tumors Arise from Villi?-Part 2

- Cr localizes to duodenal villi of rats from Thompson et al. (2012).
- Rats in NTP study likely had some Cr in villi (as evidenced by liver Cr data, for example), yet no tumors.
- Suggests that toxicity-induced regenerative hyperplasia is requisite.
